

A multifunctional tool

The **Rörvik family camping** near the small village of Hamburgsund is located right next to a beautiful Swedish Fjord. The rocky coastline makes it perfect for families to park their caravan or rent a cabin. Lying on the pier are many baskets to catch wild lobsters next to the fishing boats on the water.

This is where we meet the owner of the camping. Jonas Christiansson is the 3rd generation who runs the daily business. He tells us about his experience with the KUBOTA RT210:

“Before I bought the RT210 I used to do a lot with a big tractor. But this was becoming more complicated as the tractor is very large and not able to get everywhere. But now I can push and pull caravans up to 800kg into their place. This summer we even pushed a 550kg caravan up a slope to get it next to the wooden terrace.”

The KUBOTA RT210 is not only used for helping customers move their caravans. Mr. Christiansson uses it also to clean the camping and the beaches.

“I bought the sweeper right after I had the delivery of the machine. With the standard hydraulic function it is easy to sweep the roads around the camping. The holding function makes it possible to lock the mechanism so the sweeper will work continuously.

Our 4 in 1 bucket “the shark” has also multiple purposes. Every morning in the summer we pick up the eel seaweed and other litter that washes up during the night. After that the high volume bucket is picked up and we go around the camping picking up trash and waste. When the truck arrives with groceries we unload it with the pallet fork.”

“In winter time, when all guests are gone, the KUBOTA RT210 is still very useful for maintenance work”, says Mr Christiansson

“We cut and sell firewood during the winter. The RT210 with a pallet fork can pick up full pallets of wood and deliver them over a kilometer away. Winter is also the time to create new places for more caravans. After clearing rock by hand, the RT210 bring on gravel to stabilize the ground.”

“We are very happy with the KUBOTA RT210 it can go to places that other equipment are not able to reach. The pushing/pulling force is more than enough to push caravans uphill. So the machine is strong but it can also maneuver enough to park the big caravans in small spots. It is really a precision tool with big muscles.”
